HAWORTHIA AND APICRA LISTS

Haworthias and Apicras are pot plants treasured for their unique variations in plant forms. Flowers, in all instances, are very minute borne on slender branching stems and are usually white or greenish, sometimes faintly pink. Haworthia flowers are small with spreading petals and by SMALL we mean up to one-half inch in diameter. Apicra flowers are about the same but tubular or prismatic.

No attempt is made to describe these plants in detail. Between two groups of Haworthias there can be many transitional forms which make it difficult to say where sections begin or end.

The following symbols will give you some idea of many of the Haworthia plant characteristics:

- R - plants are low growing rosettes.
- E - plants are erect and tall growing - 4 to 8 inches.
- P - plants are marked with pearly white or green dots, sometimes arranged in rows; or tubercles.
- V - plants with leaves distinctly veined or lined.
- X - plants with leaves quite thick and smooth.
- XI - plants with leaves that have slender hairy teeth or at least tipped with an awn.
- * - plants are low growing with thick translucent leaves.
- ** - plants are low growing with few thick opaque leaves.

We aim to have all plants true to name insofar as possible; however, authorities are not in agreement on all names, so we offer this list with that reservation.

Prices quoted herein are for rooted cuttings. In some cases unrooted cuttings can be supplied if acceptable to the customer. Please advise. All cuttings are post-paid and subject to stock on hand. We do NOT book future orders.

To facilitate your order please give a few alternate selections otherwise we will have to refund cash on varieties which may be sold out. California customers please add 3% state salestax.

Our collections of Haworthias and apicras contain many varieties which are not being offered at this time due to the slowness in propagation of some varieties by cuttings or leaves, or difficulty in producing fertile seed.

Beginners Collections

5 for \$1.00 - our choice.

Any 10 - 35cent varieties - your choice - \$3.00

Higher priced varieties 10% discount if order totals \$5.00 or more.

GRASSHOPPER

Palmdale 6, California

2683 N. Palmdale Street

GRASSHOPPER

Grasshoppers are not plants themselves but their unique variations in plant form. However, in all instances, the very minute forms on which the grasshopper rests and usually white or greenish, sometimes slightly pink. Grasshoppers are small with spreading legs and by which we mean up to somewhat less in diameter. These flowers are about the same as the flowers on grasshoppers. The attempt is made to describe these plants in detail. Between two groups of grasshoppers there are many transitional forms which make it difficult to say where the transition begins or ends. The following examples will give you some idea of many of the grasshopper plant characteristics:

- 1 - plants are low growing prostrate.
 - 2 - plants are erect and tall growing - 4 to 8 inches.
 - 3 - plants are marked with purple white or green dots, sometimes arranged in rows or horizontal.
 - 4 - plants with leaves elliptically shaped or linear.
 - 5 - plants with leaves quite thick and smooth.
 - 6 - plants with leaves that have slender hairy teeth or are finely stippled with an eye.
 - 7 - plants are low growing with thick stems and leaves.
 - 8 - plants are low growing with few thick opaque leaves.
- It also is true that all plants have to have leaves as possible. However, sometimes and not in agreement on all names, so we offer this list with that reservation. It is noted that the leaves are for rooted cuttings. In some cases, rooted cuttings can be utilized in connection with the cuttings. All cuttings are post-paid and subject to stock on hand. As to the cost of the cuttings, we will have to refer to the cuttings which may be sold out. California cuttings are sold at 15 cents a piece. Our collection of grasshoppers and others contain many varieties which are not being offered at this time due to the slow progress of some varieties by cuttings on leaves, or difficulty in producing certain types.

GRASSHOPPER COLLECTION

For 15.00 - our choice.
For 10 - 50 cents cuttings - your choice - 10.00
When priced varieties 10¢ discount if order totals 25.00 or more.

Varieties such as the following are slow to propagate; therefore, seldom available:

H. arachnoides; H. asperiuscula; H. asperula; H. Blackbeardiana;
H. Bolusii; H. setata; H. Stayneri var. salina; H. truncata; H. viscosa.

APICRAS

Apicras are closely related to Haworthias; usually erect growing, branching from the base with five ranks of closely set leaves terminating in pungent tips. The flowers are small and tubular with only the tips of the tubes spreading.

We can supply cuttings of the following identified varieties and one variety unidentified but closely related to Apicra Jacobsoniana. Prices are for unrooted cuttings.

Apicra deltoidea - 50c.

Apicra pentagona - 35c.

Apicra pentagona variety Willdenow - 75c.
(var. Willdenow is a smaller type of pentagona)

Apicra Skinneri - 50c.
(this is not the hybrid Haw. Skinneri)

Apicra - unidentified - 75c.
(very similar to A. Jacobsoniana but grey-green foliage)
